Just explore the standard solutions provided below or ask us to customize it for your unique needs.

Fiber Optic Fusion Splicing

“

*OTDR Testing fiber
Optic Cabling
Optical Return Loss
Testing Terminating
& Jointing Dark Fiber
Networks*

”

Fusion Splicing is where two optical fibers are joined using a heat process. The process is a very complicated procedure that requires skilled fiber optic engineers as the two fibers need to be joined in such a way that light can still pass through perfectly. If the fibers are not joined correctly it could cause the light to be scattered or reflected.

A perfect splice should be almost identical to the original fiber optic cable. A tool called an electric arc is used for the heat required but the splice can also be completed using a gas flame or laser.

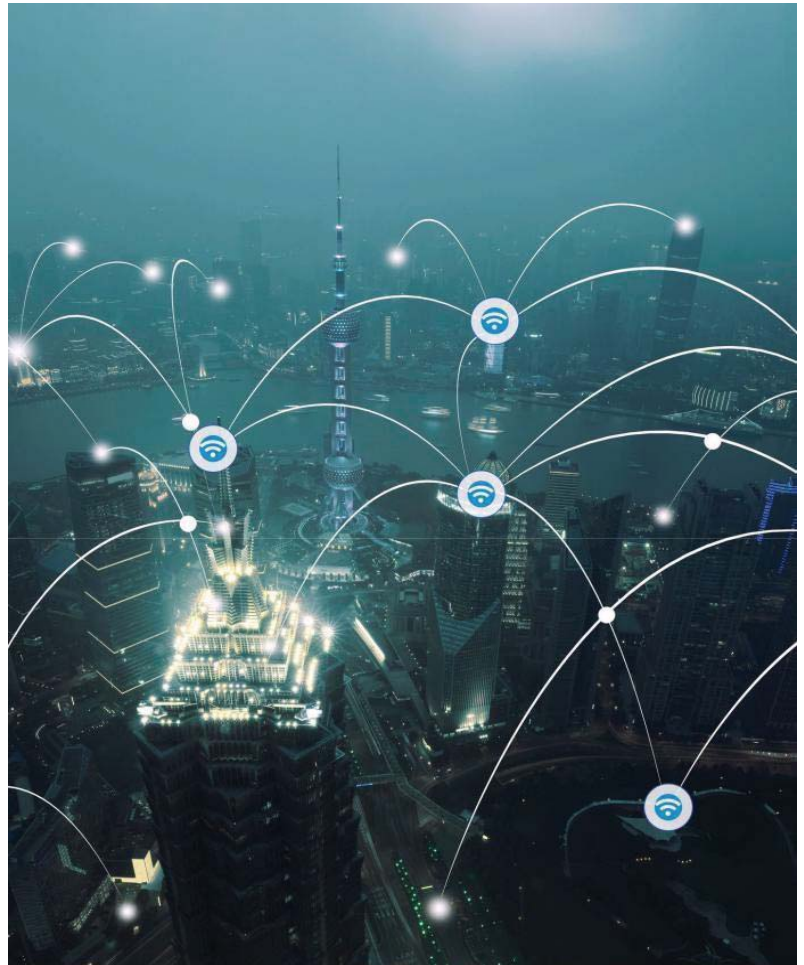

Precise heat is required when fusion splicing after the fiber ends have been prepared for the fusion process. All protective coverings must first be removed from the fiber ends.

The fiber is then cleaved to produce a completely flat fiber and checked under a microscope for any defects

Wireless Hotspot Solutions :
